

Use-Case Flow Specification

Core Use Case: Release Final High-Resolution Asset

Actors: Client Buyer, Digital Artist

Preconditions: The commission exists; the artist has uploaded the final high-resolution asset; the client is authenticated; the required milestone payment has not yet been released to the client.

Postconditions: Payment is verified; the final asset is available to the authorized client through a signed URL valid for 60 minutes; unauthorized/public access remains blocked.

Main Success Scenario

1. Client Buyer opens the completed commission and requests the final asset.
2. Order Manager checks the commission status and requests payment verification from Payment Service.
3. Payment Service confirms that the required milestone payment succeeded.
4. Order Manager requests final-asset release from Asset Storage & Secure Delivery.
5. Asset service verifies authorization and generates a signed S3 URL with a 60-minute expiry.
6. Portal presents the secure download action to the Client Buyer.
7. Client downloads the high-resolution source file before the signed URL expires.

Alternate Flow: If payment verification fails or the payment is still pending, the Order Manager does not release the final asset. The portal displays the pending/failed payment state and the client must complete or retry the milestone payment before requesting release again.

Traceability: FR-003, FR-004, FR-005 and NFR-001/NFR-002.
